Perfect primes   P22467_en

Given a natural number n, let $s(n)$ be the sum of the digits of n. In this exercise, we say that n is a perfect prime if the infinite sequence $n, s(n), s(s(n)), \ldots$ only contains prime numbers. For instance, 977 is a perfect prime, because $977, 9 + 7 + 7 = 23, 2 + 3 = 5, 5, \ldots$, are all prime numbers.

Write a recursive function that tells if a natural number n is a perfect prime or not.

Interface

C++	**bool** *is_perfect_prime* (**int** n);
C	**int** *is_perfect_prime* (**int** n);
Java	**public static boolean** *isPerfectPrime*(**int** n);
Python	*is_perfect_prime* (n) # returns bool
	is_perfect_prime (n: *int*) $\rightarrow$ *bool*

Precondition

We have $n \geq 0$.

Observation

You only need to submit the required procedure; your main program will be ignored.
